

Low angle block plane

6-3/8" long and 2" wide; body made of ductile cast iron

Combined blade advance and lateral adjust is sensitive and accurate

Two blade guide screws prevent shifting of blade

Adjustable nosepiece does not extend beyond body; can't accidentally be driven back into a sharp blade

Wide wings, multiple finger grips and accurately machined 90° angle between the sole and the sides make plane ideal for shooting

12° bed angle of plane and 25° bevel angle of blade combine to result in a 37° cutting angle

Blade is 1-5/8" wide, 1/8" thick, made of either A2 or O1 tool steel and lapped on non-bevel side to flatness tolerance of 0.0002" or better over the working surface; average roughness surface finish of 5 microinches (0.000005") or better

Can be used with optional ball tail and front knob to convert plane to a low-angle smoothing plane, albeit smaller

Optional toothed A2 steel blade with 38° bevel available
