

Stainless, PH Phillips tip

Stainless Steel does not rust, right? Wrong!!

If conventional tools are used with stainless steel components or fixings, microscopic traces from the tools get left behind on the fixings and rust over time, causing the appearance of corrosion. This effect, known as "extaneous rust", can cause chemical reactions leading to further damage to the stainless steel.

This can be prevented through the use of stainless steel tools.

Wera stainless steel screwdrivers feature

Multi-component Kraftform handle for fast and ergonomic screwdriving

Handle markings to simplify finding and sorting of tools

Hexagonal anti-roll feature against rolling away

Laser etched tip for enhanced grip of fixing
